Modul 19120 Sanitary Engineering

2. Modulkürzel: 021220012
5. Moduldauer: Einsemestrig
3. Leistungspunkte: 6 LP
6. Turnus: Wintersemester
4. SWS: 4
7. Sprache: Englisch

8. Modulverantwortlicher: Dr.-Ing. Klaus Fischer
9. Dozenten: Klaus Fischer
Harald Schönberger

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen:

12. Lernziele:
The students have detailed knowledge about waste avoidance procedures in household and industry. Waste avoidance includes the ecology-oriented daily shopping, the substitution of contaminated materials in the industrial production as well as the Zero Emission Society. In the case of unavoidable waste fractions, the students acquire the competence to establish collection and transportation systems for these wastes, within the logistic, economic and legal frame. Main emphasis is given to the collection of recyclables. The students know the relevant factors which influence the waste amount and waste composition in general and in particular within the separate collection of recyclables. The students are acquainted with the state of the art of recycling technologies for separate collected paper, glass, metal and plastic including the pretreatment process. They have knowledge of the aerobic and anaerobic treatment and utilization of separate collected biowaste. Not avoided and recycled waste has to be treated before disposing off e.g. in a landfill site. The students possess a general knowledge of the mechanical and biological treatment technology as well as of the thermal waste treatment. They are able to evaluate the different treatment and recycling processes from an ecological and economic point of view. The students have knowledge about the most important components of the urban drainage and the basic treatment processes of wastewater. Thus they are able to compare different systems in dependence of changing boundary conditions and assess the effectiveness and pros and cons of the systems, e.g. concerning impacts on the environment, economical and operational aspects. They obtain an understanding for system connections between the urban drainage system and the wastewater treatment system as well as between the urban water system and the environment.

13. Inhalt:
Solid Waste Management:
Waste generation and waste composition
National and international regulations for waste
Waste avoidance
Collection and transport of waste
Separate collection of recyclables
Sorting of recyclables
Recycling technologies for paper, glass, metal, plastic
Biological treatment of waste
Waste Disposal
Ecological indicator systems

Waste Water Technology:
Basics of urban drainage and municipal wastewater treatment
Quantity and Composition of Wastewater
Urban drainage systems
stormwater treatment
mechanical wastewater treatment
biological wastewater treatment
sludge treatment
natural close and ECOSAN systems

14. Literatur:

15. Lehrveranstaltungen und -formen:
• 191201 Vorlesung Solid Waste Management
• 191202 Vorlesung Waste Water
• 191203 Exkursion Sanitary Engineering

16. Abschätzung Arbeitsaufwand:
Time of attendance:
I Solid Waste Management, lecture: 2.0 SWS = 28 hours
II Waste Water: 2 SWS = 28 hours
excursion: 12 hours
exam: 2 hours
sum of attendance: 70 hours
self-study: 110 hours
total: 180 hours

17. Prüfungsnummer/n und -name:
• 19121 Solid Waste Management and Waste Water Technology (PL),
  Schriftlich, 120 Min., Gewichtung: 1
• V Vorleistung (USL-V), Schriftlich oder Mündlich

18. Grundlage für ...:
Urban Drainage and Design of Wastewater Treatment Plants
Industrial Waste Water

19. Medienform:

20. Angeboten von:
Abfallwirtschaft und Abluft
Modul: 50090 Environmental Fluid Mechanics I

2. Modulkürzel: 021420012
5. Moduldauer: Einsemestrig
3. Leistungspunkte: 6 LP
6. Turnus: Wintersemester
4. SWS: 5
7. Sprache: Englisch

8. Modulverantwortlicher: apl. Prof. Dr.-Ing. Holger Class
9. Dozenten: Holger Class
Jürgen Braun
Sergey Oladyshkin

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen:
- Technical Mechanics
  - Introduction to the statics of rigid bodies
  - Introduction to elastostatics
  - Introduction to the mechanics of incompressible fluids
- Higher Mathematics
  - Partial differential equations
  - Vector analysis
  - Numerical integration
- Fundamentals of Flow Mechanics
  - Conservation equations for mass, momentum, energy
  - Navier-Stokes, Euler, Reynolds, Bernoulli equation

12. Lernziele: Students have fundamental knowledge of flow in various natural hydrosystems and its application in civil and environmental engineering.

13. Inhalt: The lecture deals with flow in natural hydrosystems with particular emphasis on groundwater / seepage flow and on flow in surface water / open channels. Groundwater hydraulics includes flow in confined, semi-confined and unconfined groundwater aquifers, wells, pumping tests and other hydraulic investigation methods for exploring groundwater aquifers. In addition, questions concerning regional groundwater management (z.B. recharge, unsaturated zone, saltwater intrusion) are discussed. Using the example of groundwater flow, fundamentals of CFD (Computational Fluid Dynamics) are explained, particularly the numerical discretisation techniques finite volume und finite difference. The hydraulics of surface water deals with shallow water equations / Saint Venant equations, unstationary channel flow, turbulence und layered systems. Calculation methods such as the methods of characteisitics are explained. The contents are:
  - Potential flow and groundwater flow
  - Computational Fluid Dynamics
  - Shallow water equations for surface water
  - Charakteristikemethode
  - Examples from civil and environmental engineering

10. Zuordnung zum Curriculum in diesem Studiengang: 

11. Empfohlene Voraussetzungen: 

12. Lernziele: 

**Advanced Studies in Hydraulic Structures**: The students,

- know about the basic features of hydraulic structures
- have an overview what are the main components and know how to arrange them in order to ensure a satisfying operation
- are able to dimension all parts of different hydraulic structures
- are aware of implicating river works into an overall context of a fluvial system and know how to act and to evaluate in spatial and temporal interrelation
- are able to realize the economic and ecologic significance of hydraulic structures as dams, reservoirs and hydro power plants

**Case Study in Hydraulic Structures**: The students,

- are able to use of the gained theoretical knowledge with the help of a practical example
- are aware of the technical relations and their effects on non-technical areas of interest
- can give a well-founded argumentation of chosen estimations and are able to present their own results
- can give a convincing presentation
- are able to assess objectively different planning alternatives

13. Inhalt: 

**Advanced Studies in Hydraulic Structures**: The course deals with main structural components of hydraulic engineering schemes such as weirs, dams, hydro power plants, pipelines and ancillary works. The main features as hydraulic and structural dimensioning are treated. The application of structural power plants, reservoirs and river development works is discussed. Conventional engineering methods as well as approaches with improved environmental compatibility are taken into consideration.

**Case Study in Hydraulic Structures**: The case study uses the content of the lecture "Advanced Studies in Hydraulic Structures". In working groups of 3 to 5 students a real hydraulic structures will be planned and completely dimensioned. There are hydraulic calculations to be carried out as hydraulic capacity of spillway, dimensioning of stilling basin, hydrological and sedimentological calculations. As well the stabilities of the structures itself has to
be checked. Additionally an analysis of the demand of potentially provided electricity, drinking water or irrigation water, resp. is required. The intermediate results will be presented by the groups. Every student has to deliver at least one presentation. Finally a poster for the final presentation and assessment has to be designed. This is the basis for the development of the assessment criteria for the different alternatives.

14. Literatur:
Lecture notes can be downloaded from the internet. Additional detailed information for the case study will be provided during the lectures.

Stefan Haun

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: none (BAU), advisable LWW_Wabau  
one (UMW), advisable LWW_Gew  
Hydraulic Structures (WAREM)

12. Lernziele:

River Engineering and Sediment Management
The students,
• are aware of rivers must be regarded and managed based on an integrated approach
• know the basic concept of the European Water Framework Directive (WFD) and the German legal framework for river basin management
• are able to analyze and estimate the consequences of the WFD based inventory for future management
• are aware of sediment transport processes and of the complexity of the interactions and relations
• recognize the possibilities and limitations of sediment management strategies

Integrated Flood Protection Measures
The students,
• are aware of the fact that flood protection is an integral process, based on different components (e.g. technical flood protection measures, prevention)
• know the basic physical processes: dynamics of flood events, calculation of discharges and water depths, flood wave propagation, functionality of retention and protection structures: reservoirs, dams and dikes
• know 1-D and 2-D numerical hydro-dynamic models
• are able to apply their knowledge on practical engineering problems related to flood protection

13. Inhalt:
The module consists of two lectures:
River Engineering and Sediment Management
• Basic approaches of river basin management (legal framework)
• Systematics and results of basic inventory due to the WFD
• Anthropogenic impacts on river basins
• Origin of sediments and fundamental principles of transport
• Sediment management measures on different scales

Integrated Flood Protection Measures
• Socio-economic aspects of flood damage
• Calculation of water depths
• Hydro-dynamic flood wave calculation, Saint Venant-equation
- Technical flood protection measures
- Design and operation of retention basins
- Set-up of damage and risk maps, design of overtopping earthen dams and dikes
- Probability of failure, reliability calculation, flood risk management

14. Literatur:
Lecture notes and exercise material can be downloaded from the internet. Hints are given for additional literature from the internet as well as libraries.

15. Lehrveranstaltungen und -formen:
- 150101 Vorlesung River Engineering and Sediment Management
- 150102 Vorlesung Integrated Flood Protection

16. Abschätzung Arbeitsaufwand:
Time of attendance: 55 h
Private study: 125 h

17. Prüfungsnummer/n und -name:

8. Modulverantwortlicher: Dr. Sabine-Ulrike Gerbersdorf
9. Dozenten: Ralf Minke
Sabine-Ulrike Gerbersdorf

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: None

12. Lernziele:

**Power Demand, Supply and Distribution:**
The students,
- know the German, European and worldwide energy markets related to demand, supply and its distribution capabilities
- are aware of that non-renewable energy sources are strictly limited and time-scales for conversion of energy markets long
- have an idea about the relations between energy, politics, social changes and influences on environment
- have a basic knowledge about present energy conversion systems, theoretical limits of efficiencies, and the potential to enhance applied technology
- have a basic understanding about where and how energy is provided and distributed
- comprehend the balance between load and supply in electrical grids and the resulting necessity for control energy.

**Water Demand, Supply and Distribution:**
The students,
- know the German and worldwide water systems related to demand, supply and its distribution capabilities
- have an overview on the water supply situation all over the world.
- recognize the different possibilities and levels of water supply
- have an idea of the relations between water, politics, social changes and influences on environment.

13. Inhalt:

**Power Demand, Supply and Distribution:**
- Energy demand, energy supply
- Energy generation
  - overview of different types of power plants
  - renewable energy
  - thermal power plants (conventional and nuclear)
- Areas of application of different power plants
- Emission control techniques
- Cooling of thermal power plants
  - methods
  - water resources aspects
- Energy transport and energy storage
- Net techniques
- Energy market
  - trade
- politics
- law
- social changes due to energy supply

**Water Demand, Supply and Distribution:**
- Water supply and water distribution: necessity, basic requirements, elements, hydrological cycle
- Water demand calculation: water consumption, water demand, consumer groups, losses, forecasting, design periods
- Water collection: Selection of source, groundwater withdrawal, springwater tapping, surface water intakes, rainwater harvesting, seawater desalination, recycling of treated sewage, drinking water protection areas
- Water transmission and distribution: necessity, hydraulic basics, dimensioning and calculation of branched and closed loop systems.
- Pumps and pumping stations: necessity, types, hydraulics for pumping design, pumping stations and pressure boosters
- Water storage: necessity, types and functions of tanks and reservoirs
- Case study: planning and design of a water supply system for a small town

14. Literatur: Lecture notes can be downloaded from the internet. Hints are given for additional literature from the internet as well as libraries.

               Bertram Kuch
               Daniel Doblaw

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen:

12. Lernziele:

**Lecture: Inorganic chemistry**

The students

- know the fundamental concepts of chemistry (atomic structure, periodic system, chemical formulae, stoichiometry, molecular structures) and are able to use them,
- know the principle types of chemical substances and chemical reactions and can apply their knowledge to synthetic problems,
- know about the most important industrial compounds, their preparation and environmental aspects in their application.

**Lecture: Organic chemistry**

The students

- can identify important functional groups in organic molecules
- know the main compound classes in organic chemistry and the common rules for their nomenclature
- know the most important representatives thereof and are able to draw their structural formulae
- know the structure and properties of important bio-molecules such as fats, carbohydrates, proteins, nucleic acids, ATP, lignin and humic acids
- know the most important reactions involved in chemical and microbial degradation of organic matter
- know summary parameters used to characterize water quality
- know the properties of bio-molecules and can explain their general function with respect to cell structures, enzymatic and immune reactions

- knows selected environmental organic contaminants (PAH, dioxins, pesticides etc.) and their properties

**Lecture: Biology and ecology of water, soil and air systems**

The students

- know about the relation between water, soil and air compartments and many diseases, happening especially in developing countries

- know about the reasons for break out of diseases, the structure and function of prokaryotic and eucaryotic cells as well as the methods for identification and determination of growth conditions and possible growth limitations

- comprehend microbial metabolism, energy production, release and conservation, enzyme syntheses and their regulation.

- know important events and scientists in the history of biology

- know basics in ecology of natural and artificial ("technical") ecosystems as well as selected methods to detect distorted equilibria in technical ecosystems influenced by mankind

**Lecture: Technical and medical microbiology for engineers**

The students

- know the most important microorganisms being active in plants treating waste water, air and contaminated soil

- know the kind of participation in purification and thus the procedures used to make them feel happy as well as the problems associated with excess biomass

- are aware of a detailed overview of the kind of medically important microorganisms and of the most relevant agents of illness met in these plants, this holds also for the compartments 'drinking water' and 'sewage sludge'.

13. Inhalt:

**Lecture: Inorganic chemistry**

- atomic structure: stable nuclear particles, atomic nuclei, isotopes and radioactivity, atomic spectra and the hydrogen atom, heavier atoms

- the periodic system of the elements: the sequence of elements, the electronic configuration of some elements, the periodicity of some properties
• chemical bonding: the ionic bond, the metallic bond, the covalent bond, hydrogen bonding, van der Waals forces
• quantitative Relationships and Stoichiometric Equations
• characterizing chemical reactions: the chemical equilibrium, water: the solvent, acid/base reactions, redox reactions
• descriptive part: selected chemical compounds and their preparation and properties

**Lecture: Organic chemistry**
• functional groups and compound classes
• classification of chemical reactions in organic chemistry
• organic bio-molecules (e.g. proteins, carbohydrates, nucleic acids, fats, humic acids, lignin): structure and function
• chemical and microbial degradation of organic matter in the environment
• summary parameters
• organic environmental contaminants

**Lecture: Biology and ecology of water, soil and air systems**
The following topics are presented within the lecture:
• Introduction in history of microbiology
• Important water-based/water related diseases
• Function of microscopy of staining techniques
• Structure and function of prokaryotic cells
• Structure and function of eucaryotic cells
• Necessity and effects of microbial nutrition
• Microbial growth relations and possible limitations
• Microbial metabolism: Energy production, conservation and release
• Microbial metabolism: Enzymes syntheses and regulation.

**Lecture: Technical and medical microbiology for engineers**
• Important (sewage) water based /water related diseases/ detection and possible countermeasures
• Important soil and air connected diseases
• (micro)biological principles in application of engineering techniques
• Implication of engineer work on ecosystems /environment protection problems

Some test systems for estimation of (bio)degradability of chemicals will be evaluated

14. **Literatur:**
Lecture notes
pdf download of powerpoint slides for lectures
Exercises as hand-out or download (pdf)

15. **Lehrveranstaltungen und -formen:**
• 191001 Lecture Inorganic chemistry
• 191002 Lecture Organic chemistry
• 191003 Lecture Biology and ecology of water, soil and air systems
• 191004 Lecture Technical and medical microbiology for engineers

16. **Abschätzung Arbeitsaufwand:**
Time of attendance:
Inorganic chemistry (Schwederski): Lecture, 1 SWS = 14 hours
Organic chemistry (Metzger/Kuch): Lecture, 1 SWS = 14 hours
Biology and ecology of water, soil and air systems (Engesser):
Lecture,
1 SWS = 14 hours
Technical and medical microbiology for engineers (Engesser):
Lecture,
1 SWS = 14 hours
Exercises for Chemistry and Biology for environmental engineers,
2 SWS = 28 hours
Exam: 2 hours
Sum of attendance: 86 hours
Exercises (group work with presentations): 28 hours
Self-study: 94 hours:

17. Prüfungsnummer/n und -name: 19101 Chemistry and Biology for Environmental Engineers (PL), Schriftlich oder Mündlich, 120 Min., Gewichtung: 1

18. Grundlage für ... :

19. Medienform: Video projector (powerpoint) presentation explanations on blackboard, group work with presentations

20. Angeboten von: Hydrochemie und Hydrobiologie in der Siedlungswasserwirtschaft
Modul: 19310 Urban Drainage and Design of Wastewater Treatment Plants

2. Modulkürzel: 021210251
5. Moduldauer: Einsemestrig

3. Leistungspunkte: 6 LP
6. Turnus: Sommersemester

4. SWS: 5
7. Sprache: Englisch

8. Modulverantwortlicher: Dr.-Ing. Ulrich Dittmer

9. Dozenten: Harald Schönberger
Ulrich Dittmer

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: Chemistry and Biology for Environmental Engineers
Sanitary Engineering

12. Lernziele:
Advanced knowledge of processes and concepts for urban drainage and municipal wastewater treatment systems
Basics of construction and dimensioning of different urban drainage systems, stormwater treatment facilities and wastewater treatment plants as a base for dimensioning and discussion of proved and innovative technologies
Deeper understanding for system connections as base for a decisions during the planning process

13. Inhalt:
Design of sewer systems and stormwater treatment (Dr.-Ing. Ulrich Dittmer)
principles of collection and disposal
design of combined and separate sewer systems
Sustainable urban drainage systems (SUDS) and low impact design (LID)
Application of rainfall runoff models (computer exercise using U.S.
EPA Stormwater Management Model)
different techniques for treatment and retention
design of treatment facilities
Design of wastewater treatment plants (Prof. Dr.-Ing.
Heidrun Steinmetz)
Municipal wastewater treatment
different techniques for advanced biological wastewater treatment
(nitrogen and phosphorous removal)
principles of process engineering
design of biological wastewater treatment plants and the main important aggregates
design of sludge treatment plants
Seminar: feasibility studies
(Prof. Dr.-Ing. Heidrun Steinmetz and external consultants)
special examples for sanitation concepts for world wide application
Ecological sanitation and resource orientated systems
case studies

14. Literatur:

15. Lehrveranstaltungen und -formen:
- 193101 Vorlesung und Übung Design of Sewer System and Stormwater Treatment
- 193104 Exkursion
- 193102 Vorlesung und Übung Design of Wastewater Treatment Plants
- 193103 Seminar Case Study

16. Abschätzung Arbeitsaufwand:
Time of attendance: approx. 70 hours (including 4*4 hours for excursion) 1,5 SWS
Private Study: approx. 110 hours
Lecture 1: Presence time: 28 hours, self study 30 hours, project 0, Sum: 58 hours
Lecture 2: Presence time: 28 hours, self study 30 hours, project 40, Sum: 58 hours
Case study: Presence time: 14 hours, self study 10 hours, project 0, Sum: 25 hours

17. Prüfungsnummer/n und -name: 19311 Urban Drainage and Design of Wastewater Treatment Plants (PL), Schriftlich, 120 Min., Gewichtung: 1

18. Grundlage für ... :

19. Medienform:

20. Angeboten von: Siedlungswasserbau und Wassergüterwirtschaft
Modul: 19360 Water Quality and Treatment

2. Modulkürzel: 021210051
3. Leistungspunkte: 6 LP
4. SWS: 4
5. Modul dauer: Einsemestrig
6. Turnus: Sommersemester

8. Modulverantwortlicher: Carsten Meyer
9. Dozenten: Harald Schönberger
Carsten Meyer

11. Empfohlene Voraussetzungen: Knowledge in Sanitary Engineering, Water Supply and Hydraulics
Contents of Water and Power Supply

12. Lernziele:
• The students learn how to characterize and protect water bodies as well as to improve the water quality
• Students understand the contribution of wastewater treatment to the preventive protection of receiving waters and they learn the basic methods of water quality management instruments
• Students understand the necessity of water treatment as essential element of drinking water supply
• Students learn the chemical, physical and biological background of water treatment technologies, their possibilities and boundaries and they are able to develop, design and dimension treatment schemes for different raw water qualities

13. Inhalt:
Water Quality Management:
• Terms and introduction: environmental data from Germany
• Characterisation and assessment of flowing waters, stagnant waters and groundwater
• Water quality parameters, WHO drinking water guidelines, targets for drinking water and sanitation, description of water quality in relation to use
• Improvement of water quality, reduction of pollution load, point pollutants and diffuse loads, improving the self-purification capacity of waters, technical helps, assessment of progress
• Water quality management, the European Union Framework Directive, quality planning and maintenance, monitoring networks

Water Treatment:
• Water supply and water treatment: basic requirements, drinking water standards
• Mechanical treatment: Screening, Sieving, Sedimentation, (Membrane)Filtration, Gas-Exchange, Flotation
• Carbondioxide-Carbonate-Balance: relevance, chemical background
• Deacidification: mechanical and chemical methods
• Removal of iron, manganese and arsenic: methods
• Decarbonization: chemical methods
• Flocculation
• Adsorption
• Disinfection: chemical and physical methods
14. Literatur:
Lecture notes and material for exercises will be provided during the
lecture. Hints are given for additional literature from the internet as
well as libraries, e.g.

9. Dozenten: Andras Bardossy
Sergey Oladyshkin

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen:
Recommended background knowledge: basic knowledge of environmental fluid mechanics, hydrology and geohydrology
Prerequisite module: none

12. Lernziele:
Hydrological Modeling:
Construction of models for each part in the runoff process and how these models are used and integrated in different environment management systems.

Integrated model systems for the groundwater management:
Groundwater and hydrological modelling, Calibration and Validation, Stochastic modelling

13. Inhalt:
Hydrological Modeling:
What happens to the rain? This is the basic question that needs to be addressed in order to predict the amount of discharge at a certain location in a river system at a given time. Which parts of the fate of rainfall can be determined on a physical basis, and which are still left to empirical searching? Beside the qualitative determination of e.g. the processes of evapotranspiration, infiltration, interflow etc. we also need to describe the quantities of these processes to be able to forecast e.g. flood events. Hydrological watershed modelling is fundamental to integrated water management. There are complex interactions between the elements of the environmental continuum. In order to predict future behaviour and to quantify effects of management changes, quantitative mathematical descriptions are needed. A number of advanced hydrological watershed models have been developed in the last 30 years. A few of them will be reviewed in terms of their data needs and there predictive power. The participants are encouraged to form groups and to use their selected models for the same catchment so that the different approaches are compared.

Integrated model systems for the groundwater management:
Water is unique – no other element is so ubiquitous, vital, vulnerable and threatening at the same time. We must secure our access to clean water, shield our civilization from droughts and floods, use water sustainably in food and energy production, and protect water as part of our environment. However our surroundings behave non-trivially in various time and spatial scales. Moreover, many environmental systems such as hydrological systems (precipitation, evaporation, infiltration, groundwater flow, surface flow, etc.) are heterogeneous, non-linear...
and dominated by real-time influences of external driving forces. Unfortunately, a complete picture of surroundings water systems is not available, because many of these systems cannot be observed directly and only can be derived using sparse measurements. Modeling plays a very important role in reconstructing (as far as possible) the complete and complex picture of the surroundings water systems and offers a unique way to predict behavior of such multifaceted systems. The current course deals with Integrated Watershed Modelling. The main modelling principles are discussed that helps adequately describe the natural system and it's behavior on the basis of the corresponding physical processes. It's imply assumptions about physical concepts, numerical schemes, mathematical formulations, boundary conditions and modelling parameters. The course offers concepts how to incorporate the data into the modelling process, how to calibrate the established model and how to perform validate against the available observation data. The course introduces theoretical concepts and demonstrates how to transfer them into practical applications using hydrological and groundwater modelling. This course is offering insights into the MODFLOW Software that is the USGS's modular hydrologic model. MODFLOW is considered an international standard for simulating and predicting groundwater conditions and groundwater/surface-water interactions. Additionally course is exploring some features of MATLAB software as one of most productive software environment for engineers and scientists.

Modul: 50140 Modeling of Hydrosystems

4. SWS: 5  7. Sprache: Englisch

8. Modulverantwortlicher: Univ.-Prof. Dr.-Ing. Rainer Helmig
9. Dozenten: Bernd Flemisch  Rainer Helmig

11. Empfohlene Voraussetzungen: 
   Recommended background knowledge:
   Higher Mathematics:
   • Partial differential equations
   • Numerical integration
   Fundamentals of fluid mechanics:
   • Conservation equations for mass, momentum, energy
   • Mathematical descri

12. Lernziele:
   Students can select suitable numerical methods for solving problems from fluid mechanics and have basic knowledge of implementing a numerical model in C.

13. Inhalt:
   Discretisation methods:
   • Knowledge of the common methods (finite differences, finite elements, finite volume) and the differences between them
   • Advantages and disadvantages and of the methods and thus of their applicability
   • Derivation of the various methods
   • Use and choice of the correct boundary conditions for the various methods

   Time discretisation:
   • Knowledge of the various possibilities
   • Assessment of stability, computational effort, precision
   • Courant number, CFL criterion

   Transport equation:
   • Various discretisation possibilities
   • Physical background
   • Stability criteria of the methods (Peclet number)

   Clarification of concepts: model, simulation
   Application of the finite element method to the stationary groundwater equation Setting-up of a simulation programme for modeling groundwater:
   • Programme requirements
   • Programming individual routines

   Fundamentals of programming in C:
   • Control structures
   • Functions
   • Arrays
   • Debugging
### Visualisation of the simulation results

Hydromechanik und Hydrosystemmodellierung
Modul: 50150 Stochastical Modeling and Geostatistics

4. SWS: 4  7. Sprache: Deutsch

8. Modulverantwortlicher: Dr. Jochen Seidel
9. Dozenten: Wolfgang Nowak, András Bárđossy

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: Recommended background knowledge: Basic knowledge of statistics
Prerequisite module: none

12. Lernziele:
- **Concepts of Geostatistics:** Knowledge of the basic geostatistical concepts, difference between Kriging and simulation, advantages and disadvantages of the discussed methods, application of Kriging and simulation
- **Stochastical Modeling:** The participants have skills in basic statistical methods used in hydrology, like time series analysis, extreme value statistics, parameter estimation methods and statistical tests.

13. Inhalt:
- **Concepts of Geostatistics:** Geostatistical procedures for the interpolation of measured values, assessment of model parameters and planning of Measuring networks are dealt with.
  - Contents:
    - Introduction
    - Statistical hypotheses: Basic concepts, Regionalized variables, Second order stationarity, Intrinsic hypothesis, Comparison of the two hypotheses, Selection of the regionalized variable
    - The variogram: The experimental variogram, The theoretical variogram, Variogram models, Variogram fitting, Isotropy - anisotropy
    - Ordinary Kriging: Point kriging, Block kriging, Properties of ordinary kr., Kr. as an interpolator, Kr. and the variogram, Practice of kr., Selection of the neighbourhood, Kr. with a "false" variogram, Cross validation, Kr. with uncertain data, Simple Kr.
    - Non stationary methods: Universal kr., Intrinsic random functions of order k, External-Drift-Kr.
    - Indicator Kriging: Indicator Kriging, Applications
    - Kriging with arbitrary additional information: Markov-Bayes-Kriging, Simple Updating (SU)
    - Time dependent variables
    - Exercises

- **Stochastical Modeling:** The lecture part stochastic modeling is primarily concerned with the stochastic analysis of temporal and areal arrays, their
generation and their use in the hydrological modeling. Calculation and analysis of hydrological data, descriptive statistic and their parameters, possibility analysis, correlation and regression, time series analysis and simulation.

Content:
- Univariate Statistics and multivariate Statistics (e.g. regression analysis)
- theory of probabilities
- random variables and probability functions (e.g. Poission distribution)
- estimation of parameters (e.g. Maximum Likelihood Method)
- statistical tests (e.g. Kolmogorov-Smirnov test)
- extreme value statistics (analysis of the frequency of occurrence of floods)
- time series analysis (e.g. ARMA Models)
- stochastic simulations (Monte-Carlo Methods)

none (UMW), advisable LWW_Gew
Hydraulic Structures (WAREM)
12. Lernziele:
River Engineering and Sediment Management
The students,
• are aware of rivers must be regarded and managed based on an integrated approach
• know the basic concept of the European Water Framework Directive (WFD) and the German legal framework for river basin management
• are able to analyze and estimate the consequences of the WFD based inventory for future management
• are aware of sediment transport processes and of the complexity of the interactions and relations
• recognize the possibilities and limitations of sediment management strategies

Integrated Flood Protection Measures
The students,
• are aware of the fact that flood protection is an integral process, based on different components (e.g. technical flood protection measures, prevention)
• know the basic physical processes: dynamics of flood events, calculation of discharges and water depths, flood wave propagation, functionality of retention and protection structures: reservoirs, dams and dikes
• know 1-D and 2-D numerical hydro-dynamic models
• are able to apply their knowledge on practical engineering problems related to flood protection

13. Inhalt: The module consists of two lectures:
River Engineering and Sediment Management
• Basic approaches of river basin management (legal framework)
• Systematics and results of basic inventory due to the WFD
• Anthropogenic impacts on river basins
• Origin of sediments and fundamental principles of transport
• Sediment management measures on different scales

Integrated Flood Protection Measures
• Socio-economic aspects of flood damage
• Calculation of water depths
• Hydro-dynamic flood wave calculation, Saint Venant-equation
• Technical flood protection measures
• Design and operation of retention basins
• Set-up of damage and risk maps, design of overtopping earthen dams and dikes
• Probability of failure, reliability calculation, flood risk management

14. Literatur: Lecture notes and exercise material can be downloaded from the internet. Hints are given for additional literature from the internet as well as libraries.

Modul: 15160 Water and Power Supply

Power Demand, Supply and Distribution:
The students,
• know the German, European and worldwide energy markets related to demand, supply and its distribution capabilities
• are aware of that non-renewable energy sources are strictly limited and time-scales for conversion of energy markets long
• have an idea about the relations between energy, politics, social changes and influences on environment
• have a basic knowledge about present energy conversion systems, theoretical limits of efficiencies, and the potential to enhance applied technology
• have a basic understanding about where and how energy is provided and distributed
• comprehend the balance between load and supply in electrical grids and the resulting necessity for control energy.

Water Demand, Supply and Distribution:
The students,
• know the German and worldwide water systems related to demand, supply and its distribution capabilities
• have an overview on the water supply situation all over the world.
• recognize the different possibilities and levels of water supply
• have an idea of the relations between water, politics, social changes and influences on environment.

Power Demand, Supply and Distribution:
• Energy demand, energy supply
• Energy generation
  - overview of different types of power plants
  - renewable energy
  - thermal power plants (conventional and nuclear)
• Areas of application of different power plants
• Emission control techniques
• Cooling of thermal power plants
  - methods
  - water resources aspects
• Energy transport and energy storage
• Net techniques
• Energy market
  - trade
- politics
- law
- social changes due to energy supply

**Water Demand, Supply and Distribution:**
- Water supply and water distribution: necessity, basic requirements, elements, hydrological cycle
- Water demand calculation: water consumption, water demand, consumer groups, losses, forecasting, design periods
- Water collection: Selection of source, groundwater withdrawal, springwater tapping, surface water intakes, rainwater harvesting, seawater desalination, recycling of treated sewage, drinking water protection areas
- Water transmission and distribution: necessity, hydraulic basics, dimensioning and calculation of branched and closed loop systems.
- Pumps and pumping stations: necessity, types, hydraulics for pumping design, pumping stations and pressure boosters
- Water storage: necessity, types and functions of tanks and reservoirs
- Case study: planning and design of a water supply system for a small town

14. Literatur:
Lecture notes can be downloaded from the internet.
Hints are given for additional literature from the internet as well as libraries.

- 151602 Vorlesung Water Demand, Supply and Distribution
- 151601 Vorlesung Energy Demand, Supply and Distribution

16. Abschätzung Arbeitsaufwand:
| Time of attendance: | 45 h |
| Private Study: | 135 h |

17. Prüfungsnummer/n und -name:
15161 Water and Power Supply (PL), Schriftlich, 120 Min., Gewichtung: 1

18. Grundlage für ... :

19. Medienform:

20. Angeboten von: Wasserbau und Wassermengenwirtschaft
Modul: 19100 Chemistry and Biology for Environmental Engineers

2. Modulkürzel: 021230502
3. Leistungspunkte: 6 LP
4. SWS: 6
5. Modul dau er: Einsemestrig
6. Turnus: Wintersemester
7. Sprache: Weitere Sprachen
8. Modulverantwortlicher: Univ.-Prof. Dr. Jörg Metzger
9. Dozenten: Karl Heinrich Engesser
              Brigitte Schwederski
              Jörg Metzger
              Bertram Kuch
              Daniel Doblaw

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen:

12. Lernziele:

Lecture: Inorganic chemistry

The students

- know the fundamental concepts of chemistry (atomic structure, periodic system, chemical formulae, stoichiometry, molecular structures) and are able to use them,
- know the principle types of chemical substances and chemical reactions and can apply their knowledge to synthetic problems,
- know about the most important industrial compounds, their preparation and environmental aspects in their application.

Lecture: Organic chemistry

The students

- can identify important functional groups in organic molecules
- know the main compound classes in organic chemistry and the common rules for their nomenclature
- know the most important representatives thereof and are able to draw their structural formulae
- know the structure and properties of important bio-molecules such as fats, carbohydrates, proteins, nucleic acids, ATP, lignin and humic acids
- know the most important reactions involved in chemical and microbial degradation of organic matter
- know summary parameters used to characterize water quality
- know the properties of bio-molecules and can explain their general function with respect to cell structures, enzymatic and immune reactions

- knows selected environmental organic contaminants (PAH, dioxins, pesticides etc.) and their properties

Lecture: Biology and ecology of water, soil and air systems

The students

- know about the relation between water, soil and air compartments and many diseases, happening especially in developing countries

- know about the reasons for break out of diseases, the structure and function of prokaryotic and eucaryotic cells as well as the methods for identification and determination of growth conditions and possible growth limitations

- comprehend microbial metabolism, energy production, release and conservation, enzyme syntheses and their regulation.

- know important events and scientists in the history of biology

- know basics in ecology of natural and artificial ('technical') ecosystems as well as selected methods to detect distorted equilibria in technical ecosystems influenced by mankind

Lecture: Technical and medical microbiology for engineers

The students

- know the most important microorganisms being active in plants treating waste water, air and contaminated soil

- know the kind of participation in purification and thus the procedures used to make them feel happy as well as the problems associated with excess biomass

- are aware of a detailed overview of the kind of medically important microorganisms and of the most relevant agents of illness met in these plants, this holds also for the compartments 'drinking water' and 'sewage sludge'.

13. Inhalt:

Lecture: Inorganic chemistry

- atomic structure: stable nuclear particles, atomic nuclei, isotopes and radioactivity, atomic spectra and the hydrogen atom, heavier atoms
- the periodic system of the elements: the sequence of elements, the electronic configuration of some elements, the periodicity of some properties
• chemical bonding: the ionic bond, the metallic bond, the covalent bond, hydrogen bonding, van der Waals forces
• quantitative Relationships and Stoichiometric Equations
• characterizing chemical reactions: the chemical equilibrium, water: the solvent, acid/base reactions, redox reactions
• descriptive part: selected chemical compounds and their preparation and properties

Lecture: Organic chemistry
• functional groups and compound classes
• classification of chemical reactions in organic chemistry
• organic bio-molecules (e.g. proteins, carbohydrates, nucleic acids, fats, humic acids, lignin): structure and function
• chemical and microbial degradation of organic matter in the environment
• summary parameters
• organic environmental contaminants

Lecture: Biology and ecology of water, soil and air systems
The following topics are presented within the lecture:
• Introduction in history of microbiology
• Important waterbased/water related diseases
• Function of microscopy of staining techniques
• Structure and function of prokaryotic cells
• Structure and function of eucaryotic cells
• Necessity and effects of microbial nutrition
• Microbial growth relations and possible limitations
• Microbial metabolism: Energy production, conservation and release
• Microbial metabolism: Enzymes syntheses and regulation.

Lecture: Technical and medical microbiology for engineers
• Important (sewage) water based /water related diseases/ detection and possible countermeasures
• Important soil and air connected diseases
• (micro)biological principles in application of engineering techniques
• Implication of engineer work on ecosystems /environment protection problems

Some test systems for estimation of (bio)degradability of chemicals will be evaluated

14. Literatur:

15. Lehrveranstaltungen und -formen:
• 191001 Lecture Inorganic chemistry
• 191002 Lecture Organic chemistry
• 191003 Lecture Biology and ecology of water, soil and air systems
• 191004 Lecture Technical and medical microbiology for engineers

16. Abschätzung Arbeitsaufwand:
Time of attendance:
Inorganic chemistry (Schwederski): Lecture, 1 SWS = 14 hours
Organic chemistry (Metzger/Kuch): Lecture, 1 SWS = 14 hours
Biology and ecology of water, soil and air systems (Engesser): Lecture,
1 SWS = 14 hours
Technical and medical microbiology for engineers (Engesser): Lecture,
1 SWS = 14 hours
Exercises for Chemistry and Biology for environmental engineers,
2 SWS = 28 hours
Exam: 2 hours
Sum of attendance: 86 hours
Exercises (group work with presentations): 28 hours
Self-study: 94 hours:

17. Prüfungsnummer/n und -name: 19101 Chemistry and Biology for Environmental Engineers (PL), Schriftlich oder Mündlich, 120 Min., Gewichtung: 1

18. Grundlage für ... :

19. Medienform: Video projector (powerpoint) presentation explanations on blackboard, group work with presentations

20. Angeboten von: Hydrochemie und Hydrobiologie in der Siedlungswasserwirtschaft
Modul: 19310 Urban Drainage and Design of Wastewater Treatment Plants

2. Modulkürzel: 021210251  
5. Moduldauer: Einsemestrig

3. Leistungspunkte: 6 LP  
6. Turnus: Sommersemester

4. SWS: 5  
7. Sprache: Englisch

8. Modulverantwortlicher: Dr.-Ing. Ulrich Dittmer

9. Dozenten: Harald Schönberger  
Ulrich Dittmer

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: Chemistry and Biology for Environmental Engineers  
Sanitary Engineering

12. Lernziele:

Advanced knowledge of processes and concepts for urban drainage and municipal wastewater treatment systems

Basics of construction and dimensioning of different urban drainage systems, stormwater treatment facilities and wastewater treatment plants as a base for dimensioning and discussion of proved and innovative technologies

Deeper understanding for system connections as base for a decisions during the planning process

13. Inhalt:

Design of sewer systems and stormwater treatment  
(Dr.- Ing. Ulrich Dittmer)
principles of collection and disposal
 design of combined and separate sewer systems
 Sustainable urban drainage systems (SUDS) and low impact design(LID)
 Application of rainfall runoff models (computer exercise using U.S. EPA Stormwater Management Model)
 different techniques for treatment and retention
 design of treatment facilities
 Design of wastewater treatment plants (Prof. Dr.-Ing. Heidrun Steinmetz)
 Municipal wastewater treatment
different techniques for advanced biological wastewater treatment 
(nitrogen and phosphorous removal) 
principles of process engineering 
design of biological wastewater treatment plants and the main important aggregates
 design of sludge treatment plants
 Seminar: feasibility studies
 (Prof. Dr.- Ing. Heidrun Steinmetz and external consultants)
special examples for sanitation concepts for world wide application
Ecological sanitation and resource orientated systems case studies

**10. Zuordnung zum Curriculum in diesem Studiengang:**

**11. Empfohlene Voraussetzungen:**

**12. Lernziele:**
- a basic understanding for the problems and requirements of industrial waste water treatment
- an overview of measures for production integrated environmental protection, relevant treatment methods for process water and its characterization
- an overview of water analysis including sampling, the main principles of different analytical techniques and the ways to assure the quality of chemical analysis

**13. Inhalt:**
- Fundamentals of industrial waste water treatment
- Determination of current situation possible process integrated measures, arrangements for reuse and recirculation of water mass and concentration balance
- Basic elements and examples for applications of advanced purification processes
- Biological waste water treatment
- Sampling and analytical techniques using on-site measurements, oxidation - reduction, acids and bases, sum parameters, photometry, spectrometry and chromatography
- Analytical quality assurance

**14. Literatur:**
- lecture notes (approx. 400 pages)
- exercises
- Deutsche Einheitsverfahren zur Wasser-, Abwasser und Schlammuntersuchung - Standard Methods for the Examination of Water and Wastewater

**15. Lehrveranstaltungen und -formen:**
- 193301 Lecture Treatment of Industrial Waste Water
- 193302 Lecture Water Analysis and Analytical Quality Control

Modul: 19360 Water Quality and Treatment

2. Modulkürzel: 021210051  
5. Modulsdauer: Einsemestrig

3. Leistungspunkte: 6 LP  
6. Turnus: Sommersemester

4. SWS: 4  
7. Sprache: Englisch

8. Modulverantwortlicher: Carsten Meyer

9. Dozenten: Harald Schönberger  
Carsten Meyer

10. Zuordnung zum Curriculum in diesem Studiengang:

12. Lernziele:
• The students learn how to characterize and protect water bodies as well as to improve the water quality
• Students understand the contribution of wastewater treatment to the preventive protection of receiving waters and they learn the basic methods of water quality management instruments
• Students understand the necessity of water treatment as essential element of drinking water supply
• Students learn the chemical, physical and biological background of water treatment technologies, their possibilities and boundaries and they are able to develop, design and dimension treatment schemes for different raw water qualities

13. Inhalt:
Water Quality Management:
• Terms and introduction: environmental data from Germany
• Characterisation and assessment of flowing waters, stagnant waters and groundwater
• Water quality parameters, WHO drinking water guidelines, targets for drinking water and sanitation, description of water quality in relation to use
• Improvement of water quality, reduction of pollution load, point pollutants and diffuse loads, improving the self-purification capacity of waters, technical helps, assessment of progress
• Water quality management, the European Union Framework Directive, quality planning and maintenance, monitoring networks

Water Treatment:
• Water supply and water treatment: basic requirements, drinking water standards
• Mechanical treatment: Screening, Sieving, Sedimentation, (Membrane)Filtration, Gas-Exchange, Flotation
• Carbondioxide-Carbonate-Balance: relevance, chemical background
• Deacidification: mechanical and chemical methods
• Removal of iron, manganese and arsenic: methods
• Decarbonization: chemical methods
• Flocculation
• Adsorption
• Disinfection: chemical and physical methods
14. Literatur: Lecture notes and material for exercises will be provided during the lecture. Hints are given for additional literature from the internet as well as libraries, e.g.
- Nicholas P. Cheremisinoff: Handbook of Water and Wastewater Treatment Technologies, Bitterworth und Heinemann, Boston Oxford Auckland Johannesburg Melbourne New Delhi, 2002
- WHO Guidelines, 2006

Ralf Minke
Matthias Rapf
Detlef Clauß

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: Prerequisite Modules:
Sanitary Engineering
Urban drainage and design of Wastewater treatment plants
Chemistry and Biology for Environmental Engineers

12. Lernziele:
The student knows and understands in theory and practice
- the most important parameters to characterize water and waste
water and the analytical methods to determine them (e.g. pH,
nitrate, ammonium, phosphorus, alkalinity, acidity, permanganate
index, conductivity, oxygen, loss of ignition, filterable matter).
- important techniques for removal of water contaminants (e.g.
ion exchange, precipitation, coagulation, sorption, neutralization,
aerobic, anoxic and anaerobic degradation)
- how to take representative samples out of the different waste
streams and the relevant sampling errors
The student is aware of the most important microbiological tools
to detect, handle and use microorganisms in environmental
engineering systems
The student
- is capable of interpreting and evaluating analytical data and
based on these data to draw conclusions in order to evaluate the
quality of water and the efficiency of processes for treatment of
water and solid waste.
- is able to apply the relevant laboratory test procedures to analyze
compost within the quality assurance system and to interpret the
results.
- has the competence to develop a sampling procedure for
household waste and to determine the waste composition by a
sorting analyses
- is able to apply selected test procedures in the field of hazardous
waste and the analyses of odor samples

13. Inhalt:
This course serves to the intensification of the theoretical
knowledge in sanitary engineering by practical work in the
laboratory and an accompanying student seminar. The
experiments offered belong thematically to the three main areas:
- water and waste water
- solid waste
- chemistry and microbiology
The experiments are mainly performed directly by the students in
groups of 3 to max. 6 or offered as demonstration experiments.
14. Literatur: Description of Experiments (available as download, pdf )
Handouts for seminar work

15. Lehrveranstaltungen und -formen: • 193901 Praktikum Sanitary Engineering - Practical Class
• 193903 Practical Work and Seminar Solid Waste

16. Abschätzung Arbeitsaufwand: Time of attendance (incl. seminar work): 90 h
Preparation time (before/after practical work): 90 h
Total: 180 hours

17. Prüfungsnummer/n und -name: 19391 Sanitary Engineering - Practical Class (PL), Schriftlich, 90 Min., Gewichtung: 1
written records of practical experiments

18. Grundlage für ... :

19. Medienform: • Explanation of experiments and presentation of the results of the practical work by the students (flip chart, blackboard)
• Practical Work in chemical and microbiological laboratories

20. Angeboten von: Hydrochemie und Hydrobiologie in der Siedlungswasserwirtschaft

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: prerequisite modules: Regional and Urban Planning I

12. Lernziele:
The students are acquainted with basic methods of analysis and assessment in spatial planning. The students are able to cope with function, prerequisites and methodical problems of the methods presented. The lectures demonstrate the usage of planning instruments and methods based on planning cases from Germany and other countries.

13. Inhalt:
The course Regional Planning II deals with the following planning methods:
- Indicator-based monitoring and evaluation methods
- Multi-criteria decision analysis (e.g. cost-benefit analysis, utility value analysis, analytic hierarchy process)
- Methods of impact assessment
- Techniques of demand forecast and land suitability analysis
- Hazard and vulnerability analysis (climate change adaptation)

The course Urban Planning II gives an overview on:
- Levels of spatial planning in urban areas
- Urban development planning
- Urban analysis
- Urban renewal
- Urban planning instruments
- Land use planning and implementation planning
- Legal framework

14. Literatur:

18. Grundlage für ...:

19. Medienform: Optional

20. Angeboten von: Raumentwicklungs- und Umweltplanung
Modul: 36400 Limnic Ecology

2. Modulkürzel: 021410205  
5. Moduldauer: Einsemestrig

3. Leistungspunkte: 6 LP  
6. Turnus: Wintersemester

4. SWS: 0  
7. Sprache: Englisch

8. Modulverantwortlicher: Dr. Sabine-Ulrike Gerbersdorf

9. Dozenten: Sabine-Ulrike Gerbersdorf

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: Biologie Grundkenntnisse / basic knowledge in biology

12. Lernziele:

   Knowledge on Limnology, Hydrobiology and Limnic Ecology is essential for solving problems concerned with water protection.

   Lecture Limnic Ecology
   The student knows about abiotic factors (e.g. light, nutrients, flow regime) to impact biocenosis and thus to structure habitats/biotopes. He/She understands the organisms and their metabolic activities in detail, ranging from primary producers (microalgae, macrophytes) to secondary producers and consumers up to trophic relationships (from microbial loop to higher food webs). The student is familiar with challenges for health and safety of water bodies / drinking water as well as self-purification within aquatic systems with regard to eutrophication, human impacts in a wider sense as well as natural toxic algae blooms. The student knows about the important question on the ecological balance of water bodies and strategies of biomanipulation, decontamination up to restoration in order to support the natural regeneration potential of aquatic systems. He/She understands both habitats, water column and sediment, as both compartments are strongly linked to each other and determine the overall health status.

   Seminar Selected topics in Limnic Ecology
   The student knows how to present research to an audience by practising and improving important presentation skills (soft skills) in response to appropriate feedback. At the same time he/she deepened his/her knowledge in selected topics by choosing a topic of his/her special interest from Limnic Ecology. The students learned about external lecturer and their special fields of interest and how to participate in a lively discussion.

13. Inhalt:

   Lecture "Limnic Ecology"
   This lecture gives insights into morphology and ecological principles of different water bodies (natural / artificial, groundwater, streams, lakes, drinking reservoirs etc).
   • Basic definitions and classifications schemes for a range of aquatic habitats, differences in lotic and stagnant water bodies
   • Abiotic factors and their impact on organisms and habitat: light, temperature, flow regime/turbulence, wind, water level, chemical factors, pH, conductivity, oxygen and nutrients
• Biotic factors such as competition, prey-predator relations, biological engineering as well as primary and secondary production and decomposition
• Ecosystem functions such as nutrient recycling, food webs or engineering / sediment stabilisation
• Challenges for health and safety of water bodies: natural (toxic algae) to human (eutrophication) impacts
• Strategies to re-establish or support ecological balance, is there an ecological balance?
• Important methods investigating single abiotic (e.g. oxygen, nutrients) and biotic (e.g. chlorophyll) factors as well as complex interactions on ecological level (e.g. community composition) with implications for water purity will be presented

Seminar Selected topics in Limnic Ecology
A range of possible topics (front of research or actual/political interest) will serve as a choice, but also the students can come up with own ideas

14. Literatur:

Skript, Books: "Limnische Ökologie Lothar Kalbe, "Limnoecology Winfried Lampert, Ulrich Sommer, Internet sources

15. Lehrveranstaltungen und -formen:

• 364001 Lecture Limnic Ecology
• 364002 Seminar Limnic Ecology

16. Abschätzung Arbeitsaufwand:

Lecture:
Präsenzzeit/Presence: ca. 22,5 h
Selbststudium/post-preparation: ca. 67,5 h

Seminar:
Präsenzzeit/Presence: ca. 22,5 h
Selbststudium/post-preparation: ca. 67,5 h

17. Prüfungsnummer/n und -name:

36401 Limnic Ecology (PL), Schriftlich oder Mündlich, 90 Min., Gewichtung: 1

18. Grundlage für ... :

19. Medienform:

Powerpoint, Tafel

20. Angeboten von:

Wasser- und Umweltsystemmodellierung
Modul: 36450 Special Aspects of Urban Water Management

4. SWS: 4 7. Sprache: Englisch

8. Modulverantwortlicher: Ralf Minke
9. Dozenten: Ralf Minke Ulrich Dittmer Klaus Werner König

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: Inhaltlich:
Grundlegende Kenntnisse der Gesamtkomplexität der Siedlungswasser- und Wasserwirtschaft.
Vertiefte Kenntnisse der Abwassertechnik, der Wassergütewirtschaft, der Wasserversorgung oder des allgemeinen Managements von Wasserressourcen.
Formal:
Wasserversorgungstechnik I oder Abwassertechnik I oder Waste Water Technology oder Water Quality and Treatment

12. Lernziele:
Fachlich:
Die Studierenden entwickeln ein Verständnis für Zusammenhänge über ihre Teildisziplin hinaus. Sie können bei Entscheidungen und Planungen zwischen konkurrierenden Belangen der Siedlungswasserwirtschaft, Wasserversorgung und anderer Infrastrukturbereiche fachlich fundiert abwägen.
Methodisch:
Die Studierenden können selbständig mit internationaler wissenschaftlicher Literatur zu ihrem jeweiligen Fachgebiet umgehen, Ergebnisse kritisch bewerten und so ein eigenes Bild des Standes der Wissenschaft erarbeiten und präsentieren.

13. Inhalt:
- Wechselwirkungen zwischen Teilbereichen der Siedlungswasserwirtschaft am Beispiel des Umgangs mit Regenwasser
- Jährlich wechselnde Spezialthemen entsprechend dem wissenschaftlichen und technischen Fortschritt

14. Literatur:

Modul: 50130 Integrated Watershed Modeling

2. Modulkürzel: 021430009
5. Modulsdauer: Einsemestrig

3. Leistungspunkte: 6 LP
6. Turnus: Sommersemester

4. SWS: 4
7. Sprache: Englisch

8. Modulverantwortlicher: Dr. Sergey Oladyshkin

9. Dozenten: Andras Bardossy
Sergey Oladyshkin

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: Recommended background knowledge: basic knowledge of environmental fluid mechanics, hydrology and geohydrology
Prerequisite module: none

12. Lernziele:

Hydrological Modeling:
Construction of models for each part in the runoff process and how these models are used and integrated in different environment management systems.

Integrated model systems for the groundwater management:
Groundwater and hydrological modelling, Calibration and Validation, Stochastic modelling

13. Inhalt:

Hydrological Modeling:
What happens to the rain? This is the basic question that needs to be addressed in order to predict the amount of discharge at a certain location in a river system at a given time. Which parts of the fate of rainfall can be determined on a physical basis, and which are still left to empirical searching? Beside the qualitative determination of e.g. the processes of evapotranspiration, infiltration, interflow etc. we also need to describe the quantities of these processes to be able to forecast e.g. flood events. Hydrological watershed modelling is fundamental to integrated water management. There are complex interactions between the elements of the environmental continuum. In order to predict future behaviour and to quantify effects of management changes, quantitative mathematical descriptions are needed. A number of advanced hydrological watershed models have been developed in the last 30 years. A few of them will be reviewed in terms of their data needs and there predictive power. The participants are encouraged to form groups and to use their selected models for the same catchment so that the different approaches are compared.

Integrated model systems for the groundwater management:
Water is unique – no other element is so ubiquitous, vital, vulnerable and threatening at the same time. We must secure our access to clean water, shield our civilization from droughts and floods, use water sustainably in food and energy production, and protect water as part of our environment. However our surroundings behave non-trivially in various time and spatial scales. Moreover, many environmental systems such as hydrological systems (precipitation, evaporation, infiltration, groundwater flow, surface flow, etc.) are heterogeneous, non-linear...
and dominated by real-time influences of external driving forces. Unfortunately, a complete picture of surroundings water systems is not available, because many of these systems cannot be observed directly and only can be derived using sparse measurements. Modeling plays a very important role in reconstructing (as far as possible) the complete and complex picture of the surroundings water systems and offers a unique way to predict behavior of such multifaceted systems. The current course deals with Integrated Watershed Modelling. The main modelling principles are discussed that helps adequately describe the natural system and its behavior on the basis of the corresponding physical processes. It's imply assumptions about physical concepts, numerical schemes, mathematical formulations, boundary conditions and modelling parameters. The course offers concepts how to incorporate the data into the modelling process, how to calibrate the established model and how to perform validate against the available observation data. The course introduces theoretical concepts and demonstrates how to transfer them into practical applications using hydrological and groundwater modelling. This course is offering insights into the MODFLOW Software that is the USGS's modular hydrologic model. MODFLOW is considered an international standard for simulating and predicting groundwater conditions and groundwater/surface-water interactions. Additionally course is exploring some features of MATLAB software as one of most productive software environment for engineers and scientists.

11. Empfohlene Voraussetzungen: Recommended background knowledge:
   Higher Mathematics:
   • Partial differential equations
   • Numerical integration
   Fundamentals of fluid mechanics:
   • Conservation equations for mass, momentum, energy
   • Mathematical descr
12. Lernziele: Students can select suitable numerical methods for solving problems from fluid mechanics and have basic knowledge of implementing a numerical model in C.
13. Inhalt:
   Discretisation methods:
   • Knowledge of the common methods (finite differences, finite elements, finite volume) and the differences between them
   • Advantages and disadvantages and of the methods and thus of their applicability
   • Derivation of the various methods
   • Use and choice of the correct boundary conditions for the various methods
   Time discretisation:
   • Knowledge of the various possibilities
   • Assessment of stability, computational effort, precision
   • Courant number, CFL criterion
   Transport equation:
   • Various discretisation possibilities
   • Physical background
   • Stability criteria of the methods (Peclet number)
   Clarification of concepts: model, simulation
   Application of the finite element method to the stationary groundwater equation Setting-up of a simulation programme for modeling groundwater:
   • Programme requirements
   • Programming individual routines
   Fundamentals of programming in C:
   • Control structures
   • Functions
   • Arrays
   • Debugging
Visualisation of the simulation results

3. Leistungspunkte: 6 LP  
6. Turnus: Wintersemester
4. SWS: 4  
7. Sprache: Deutsch
8. Modulverantwortlicher: Dr. Jochen Seidel
9. Dozenten: Wolfgang Nowak, András Bárdossy

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: Recommended background knowledge: Basic knowledge of statistics
Prerequisite module: none

12. Lernziele:

Concepts of Geostatistics:
Knowledge of the basic geostatistical concepts, difference between Kriging and simulation, advantages and disadvantages of the discussed methods, application of Kriging and simulation

Stochastical Modeling:
The participants have skills in basic statistical methods used in hydrology, like time series analysis, extreme value statistics, parameter estimation methods and statistical tests.

13. Inhalt:

Concepts of Geostatistics:
Geostatistical procedures for the interpolation of measured values, assessment of model parameters and planning of Measuring networks are dealt with.

Contents:
• Introduction
• Statistical hypotheses: Basic concepts, Regionalized variables, Second order stationarity, Intrinsic hypothesis, Comparison of the two hypotheses, Selection of the regionalized variable
• The variogram: The experimental variogram, The theoretical variogram models, Variogram fitting, Isotropy, anisotropy
• Ordinary Kriging: Point kriging, Block kriging, Properties of ordinary kr., Kr.as an interpolator, Kr. and the variogram, Practice of kr., Selection of the neighbourhood, Kr. with a "false" variogram, Cross validation, Kr. with uncertain data, Simple Kr.
• Non stationary methods: Universal kr., Intrinsic random functions of order k, External-Drift-Kr.
• Indicator Kriging: Indicator Kriging, Applications
• Kriging with arbitrary additional information: Markov-Bayes-Kriging, Simple Updating (SU)
• Time dependent variables
• Exercises

Stochastical Modeling:
The lecture part stochastic modeling is primarily concerned with the stochastic analysis of temporal and areal arrays, their
generation and their use in the hydrological modeling. Calculation
and analysis of hydrological data, descriptive statistic and their
parameters, possibility analysis, correlation and regression, time
series analysis and simulation.
Content:
• Univariate Statistics and multivariate Statistics (e.g. regression
analysis)
• theory of probabilities
• random variables and probability functions (e.g. Poission
distribution)
• estimation of parameters (e.g. Maximum Likelihood Method)
• statistical tests (e.g. Kolmogorov-Smirnov test)
• extreme value statistics (analysis of the frequency of occurrence
of floods)
• time series analysis (e.g.. ARMA Models)
• stochastic simulations (Monte-Carlo Methods)

   Rainer Helmig
10. Zuordnung zum Curriculum in diesem Studiengang:
11. Empfohlene Voraussetzungen: Recommended background knowledge:
   Mechanics of incompressible and compressible fluids,
   fundamentals of numerical methods in fluid mechanics,
   fundamentals of exchange and transport processes in technical and natural systems (e.g. groundwater and surface water, pipelines).
   Contents of Environmental Fluid Mechanics I
12. Lernziele: Students have the necessary grasp of hydrodynamic, physical and chemical processes and systems to be able to answer environmentally relevant questions concerning water and air quality in natural and technical systems.
13. Inhalt: The lecture deals with the heat and mass budget of natural and technical systems. This includes transport processes in lakes, rivers and groundwater, heat and mass transfer processes between compartments as well as between various phases (sorption, dissolution), conversion of matter in aquatic systems and the quantitative description of these processes. In addition to classical single fluid phase systems, multiphase flow and transport processes in porous media will be considered. On the basis of a comparison of single- and multiphase flow systems, the various model concepts will be discussed and assessed. In the accompanying exercises, example problems present applications, extend the lecture material and help prepare for the exam. Computer exercises improve the grasp of the problems and give insight into the practical application of what has been learned.

13. Inhalt:

The module comprises the following topics:
- Introduction to flood control and flood control projects around the world
- Details on flood control projects and its evaluation based on world bank procedures.
- Flood control hydrological and hydraulic procedures.
- Procedures by US Army Corps of Engineers.
- Flood control economics
- World bank procedures and practice.
- Tsunami
- Occurrence, geophysics, different types of Tsunami. Case study on Aceh, Indonesia.
- Three Gorges dam flood control project in China
- The biggest flood control dam project explained in detail.
- The SMART Tunnel, Malaysia
- The biggest flood control tunnel and road way underground built for flood reduction and roadway. This mega project is fully operational.
- Flood Control Projects in UK and Netherlands
- Special Topics: Rainfall Harvesting, Invisible flood walls, Floating Breakwaters
- Hydrological Application in Flood Control
- HEC Models exercises for river surface profiles
• MIKE computer Modelling application.

9. Dozenten: Christian Moormann

11. Empfohlene Voraussetzungen: Recommended background knowledge:
Geoengineering: Basic knowledge of mechanics and groundwater flow
Geohydrology: Basic knowledge of groundwater hydraulics
Prerequisite module: none

12. Lernziele:
Geoengineering: The students have the required skills to treat fundamental soil mechanics problems such as: groundwater flow, consolidation, slope stability, settlement and soil strength calculations.
Geohydrology: The students have a strong foundation in the applied skills required to locate, analyse, assess, develop, and protect groundwater resources.

13. Inhalt:
Geoengineering: This course includes information about the origin of soils and soil classification methods. It also includes the basics of groundwater flow as used in soil mechanics. Common geotechnical problems such as slope stability and soil consolidation are discussed and clarified. The stresses in soil, stiffness of soils and strength of soils are explained in details.
Geohydrology: Covers the most important concepts of geology and hydrogeology, the interpretation of hydrogeological information from maps, aerial photographs, geophysical measurements and field data, the principles of groundwater development and the understanding of hydrogeological systems through case studies. A brief overview is given on the analysis of hydrochemical data and isotopes.

11. Empfohlene Voraussetzungen: Kenntnisse im Bereich Hydrologie, Hydrogeologie, Fluidmechanik

12. Lernziele:

13. Inhalt:

Die Veranstaltung besteht aus einer einführenden Vorlesung und einem praktischen Teil in Form eines 2-tägigen Geländepraktikums. **Vorlesungsteil:** Theoretischer Hintergrund der auf dem Feld und im Labor angewandten Methoden, d.h. Grundlagen von Grundwasserhydraulik, Hydrogeologie und den entsprechenden Untersuchungsmethoden wie Pumpversuche und Traceversuche. **Feldpraktikum auf dem Testgelände "Horkheim" (Neckar):**

- Bodenproben / Rammkernsondierung
- Vermessung
- Piezometrische Höhe / Pumpversuch - Wiederanstiegsversuch (recovery test)
- Piezometer test / Slugtest
- Tracer-Versuch
- Grundwasserchemie
- Hydrogeologische Geländeerkundung

**Laborversuche:**

- Säulenexperimente zum Dispersionskoeffizienten und der hydraulischen Durchlässigkeit
- Korngrößenverteilung (Bodencharakterisierung)

8. Modulverantwortlicher: Univ.-Prof. Dr. Johan Alexander Huisman

9. Dozenten: Jochen Seidel
Johan Alexander Huisman
Rudolf Widmer-Schnidrig

11. Empfohlene Voraussetzungen: Recommended background knowledge:
(I) Basic knowledge in Hydromechanics/Hydraulics corresponding to a lecture with approx. 6-8 ECTS
(II) Basic physics of electricity and wave propagation

12. Lernziele: The relevant principles of key measurement methodologies used to characterize the water cycle will be introduced and discussed so that the students can assess the advantages and disadvantages of the available measurements methodologies. In addition, the students will be sensitized for potential sources of error and uncertainty of measurements.

13. Inhalt:
(I) Measuring surface hydrological fluxes
• Precipitation measurements
• Evaporation and evapotranspiration measurements
• Discharge measurements
• Water quality measurements

(II) Measuring subsurface hydrological fluxes
• Infiltration measurements
• Water potential measurements
• Physical principles of water content measurements
• Electromagnetic methods (TDR, GPR, Remote sensing)
• Electrical methods (ERT, SP, SIP)

8. Modulverantwortlicher: Univ.-Prof. Dr. Kunibert Gregor Siebert

9. Dozenten: Claus-Justus Heine

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen:

12. Lernziele:

- basic knowledge about the theory of ordinary and/or partial differential equations
- overview about numerical solution methods for these problems
- ability to link a given problem and the appropriate method
- ability to program solution methods in MATLAB

13. Inhalt:

In the first part of the semester, we will discuss algorithms for the numerical integration of ordinary differential equations (ODEs). In the second part, an introduction to partial differential equations (PDEs) and its solution by the use of the Finite Element (FE) method will be given. While the lecture focuses on the treatment of the required mathematical theory, the tutorial will place emphasis on the implementation of the developed schemes within the Matlab programming environment.

14. Literatur:

15. Lehrveranstaltungen und -formen:

- 502901 Lecture Numerical Methods for Differential Equations
- 502902 Tutorial Numerical Methods for Differential Equations

16. Abschätzung Arbeitsaufwand:

Time of attendance: approx. 33=21(L)+12(T) hours
Private Study: approx. 70 hours
Preparation of exercises: 33 hours
Coding: approx 40 hours

17. Prüfungsnummer/n und -name:

50291 Numerical Methods for Differential Equations (PL), Schriftlich, Gewichtung: 1

18. Grundlage für ...

19. Medienform:

20. Angeboten von: Angewandte Mathematik/Numerik für Höchstleistungsrechner
Modul: 50300 Planning and Design of Water Supply Facilities

2. Modulkürzel: 021210052
5. Moduldauer: Einsemestrig

3. Leistungspunkte: 6 LP
6. Turnus: Sommersemester

4. SWS: 4
7. Sprache: Englisch

8. Modulverantwortlicher: Ralf Minke
9. Dozenten: Ralf Minke

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: Knowledge in Sanitary Engineering, Water Supply and Hydraulics

12. Lernziele:
The students,

- are able to plan and design centralised water supply systems as a part of rural and urban infrastructure.
- are able to calculate dimensions of all elements of centralised water supply systems.
- are able to calculate costs of all elements of centralised water supply systems.
- have an idea of the relations between water, politics, social changes and influences on environment and on planning process.
- are able to design in detail all elements of centralised water supply systems.

13. Inhalt:

- Planning process as function of topographical, economical, social, environmental boundaries.
- Water demand calculation: water consumption, water demand, consumer groups, losses, forecasting, design periods.
- Water collection: Selection of source, groundwater withdrawal, springwater tapping, surface water intakes, rainwater harvesting, seawater desalination, recycling of treated sewage, drinking water protection areas, details of planning and design.
- Water transmission and distribution: necessity, hydraulic basics, dimensioning and calculation of branched and closed loop systems, details of planning and design.
- Pumps and pumping stations: necessity, types, hydraulics for pumping design, pumping stations and pressure boosters, details of planning and design.
- Water storage: necessity, types and functions of tanks, water towers and reservoirs, details of planning and design.
- Cost calculation: Cost functions for different facilities, Calculation process, calculation of water tariff.

8. **Modulverantwortlicher:** Anne Weiβ

9. **Dozenten:** Dr.-Ing. Andreas Hutarew

10. **Zuordnung zum Curriculum in diesem Studiengang:**

11. **Empfohlene Voraussetzungen:**

   Recommended background knowledge:
   - Basics in environmental, engineering, hydraulic structures, finance and legal administration instruments

12. **Lernziele:**

   Student is able to follow up necessary legal and administrative procedures. He understands the relation and communication necessities between the concerned faculties, parties and interest in a project. Student is able to rule the process of carrying out the project during the stages approval, financing execution and final operation

13. **Inhalt:**

   **PROJECT PREPARATION, MANAGEMENT AND FINANCE:**
   - Design criteria techno-financial - Legal procedures and clearances.
   - Influencing aspects and basic needs and techniques in project preparation
   - Civil - Steel structures - Mechanical - Electrical - Communication
   - Feasibility - Detailed Project report - Execution design
   - Interaction - Management - Start up - Acceptance approvals
   - Onsite performance - Environmental management - Groundwater relevance
   - Relationship Authorities - Owner - Suppliers - consultant - Financing institutions
   - Operation - Lab diagnostics - Applied computing
   - Conflict and dispute management techniques

   **DEALING WITH WATER ENDANGERING SUBSTANCES:**
   - Why do we need a principle of concern?
   - Legal background procedures and clearances.
   - Influencing aspects and basic needs and techniques in environmental hazard
   - Preventive civil and communication solutions
   - Interaction - Management - Documentation - Acceptance approvals
   - Onsite performance - Environmental, groundwater, soil and air relevance
   - Relationship Authorities - operator - advisor - authorization principles
   - Conflict and dispute management sequences

**PRACTICAL WORK**, Dr. Andreas Hutarew PPaM und VAws

- Selection of ongoing project sites, used for teaching
- Project locations PPaM und VAwS:
  - Hydro power stations Rottenburg / Neckar
  - Nuclear power station Phillipsburg / Rhein Pumping station
  - HEP Kostheim / Main
  - Hydro power stations Altenburg / Neckar
Lectures take partly place on projects sites and will last till early evening

Modul: 50330 Regional and Urban Planning I

2. Modulkürzel: 021100010
5. Moduldauer: Einsemestrig

3. Leistungspunkte: 6 LP
6. Turnus: Wintersemester

4. SWS: 4
7. Sprache: Englisch

8. Modulverantwortlicher: Univ.-Prof. Dr.-Ing. Jörn Birkmann

9. Dozenten: Jörn Birkmann
   Astrid Ley

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen:

12. Lernziele:
The students understand the major challenges, objectives, strategies and instruments in spatial planning and urban development in Europe as well as in developing and countries in transition. The students are acquainted with the legal framework of comprehensive and sector planning and know the capabilities and limits of public planning as "positive" and "negative" planning.

13. Inhalt:
The course Regional Planning I covers the following topics:
   - International Planning studies
   - Overview on current planning issues
   - Basic Terms of Spatial Planning
   - Strategies in Spatial Planning
   - Instruments of Spatial Planning
   - Performance of Plans, Assessing Plans

   The course Urban Planning I provides an overview on the origin of planned urban development, starting in Greece and the Roman Empire, passing through all important periods up to the 21st century. The second part introduces urbanisation processes in third world countries, planned and unplanned urban conglomerations, including Mega Cities and Global Cities.

14. Literatur:

### 10. Zuordnung zum Curriculum in diesem Studiengang:

### 11. Empfohlene Voraussetzungen:

### 12. Lernziele:

The students are able to analyze and present the development situation and problems or some specific topics related to the development of their own countries in a systematic way and to discuss development situations and problems or specific topics of other countries. They receive experience in analyzing, summarizing and presenting the aspects mentioned above in English language.

The students are able to investigate housing standards and typologies and the housing demand and supply.

### 13. Inhalt:

*The course "Development Policy and Planning: A Seminar Conference" will be conducted as a series of (a) lectures, (b) consultations and (c) seminar meetings.*

- **a)** Lectures provide an overview of development history and current issues concerning development policy and planning. Students will choose a topic of interest within this context and propose an agenda and outline for the self-study of this topic.
- **b)** Additional lectures on academic writing and presentation techniques as well as consultation hours will provide assistance for the preparation of a scientific paper on this topic.
- **c)** A conference program for seminar meetings will be set up for authors to present their work in smaller groups (plenary sessions). Students participating in a plenary session peer-review papers of presenters and participate in the discussion.

*The first part of the seminar Housing introduces housing typologies in Europe and Middle East. In the second part, participants portray the housing situation of their home countries with respect to typology, supply and demand, self-help models and spontaneous settlement patterns.*

Modul: 50350 Water Resources and Irrigation - Planning Methods and Tools

2. Modulkürzel: 021410204
5. Moduldauer: Einsemestrig

3. Leistungspunkte: 6 LP
6. Turnus: Wintersemester

4. SWS: 6
7. Sprache: Englisch

8. Modulverantwortlicher: Dr.-Ing. Kristina Terheiden

9. Dozenten: Kristina Terheiden
Jochen Seidel

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen:

12. Lernziele:

   Students know about crop water demand and supply, conservation of soil quality and, in this context, about decision making as well as planning and design processes.

   **Irrigation Issues (Terheiden):**
   Students have theoretical and practical background knowledge of irrigation and soil conservation issues.

   **Computer Applications in Water Engineering (Terheiden):**
   Students know how to apply computer programs related to irrigation- and river basin-management.

   **Multi Objective Decision Making in Water Resources Management (Seidel):**
   Students are able to apply various decision making methods and are able to use them for the appraisal of large projects such as irrigation schemes and/or river training works.

13. Inhalt:

   **Water Management and Irrigation Facilities:**
   - Water demand, scarcity and availability
   - Assessment of crop water demand
   - Irrigation facilities
   - Health hazards of irrigation facilities
   - Soil erosion and salinization

   **Computer Applications in Water Engineering:**
   Theory and application of computer programs such as
   - SimResSedim: Water and sediment balance of reservoirs
   - Sahel: Interaction between socio-economic human activities and water- and land-resources of the used area
   - Wasim: Water and salt balance in soils
   - Wepp: Water Erosion of crop- and natural land
   - Cropwat: Crop water requirements and irrigation scheduling
   - Hec-Ras, Mike11, Hydro_As 2D: One- and two-dimensional hydrodynamic modeling of river systems

   **Multi Objective Decision Making in Water Resources Management:**
   The use of evaluation and decision making methods in order to determine long term effects on planned actions will be addressed.
Registration, quantification and evaluation of project alternatives using different methods and techniques are focused:

- Cost comparison method
- Linear Programming
- Multi Objective Decision Making methods, e.g. Composite Programming, ELECTRE, MCQA
- Case study using Composite Programming
- Introduction to Game Theory and Conflict Analysis

14. Literatur: Lecture notes to
• ‘Irrigation Issues’ authored by W. Marx
• ‘Multi Objective Decision Making in Water Resources Management’, authored by A. Bardossy, J. Seidel

will be provided on the e-learning Ilias-platform for downloading. Specific material will be distributed during lectures/exercises

15. Lehrveranstaltungen und -formen:
• 503501 Lecture Water Management and Irrigation Facilities
• 503502 Lecture Computer Applications in Water Engineering
• 503503 Lecture Multi Objective Decision Making in Water Resources Management

16. Abschätzung Arbeitsaufwand: Sum 180h

17. Prüfungsnummer/n und -name: 50351 Water Resources and Irrigation - Planning Methods and Tools (PL), Schriftlich, Gewichtung: 1

Lydia Seitz
Manuel Krauß

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen:

12. Lernziele: The students have basic knowledge about basic environmental aspects in infrastructure planning concerning soils, species and biotopes, air quality and hydro systems. They know how to include environmental aspects in spatial planning and to assess environmental impacts of strategies and projects. They are aware and have gained skills in

- ecological evaluation methods (e.g. land suitability) and
- Environmental Impact Assessment

The students have first experiences in project exercises.

13. Inhalt:

A: Lecture "Ecological aspects of infrastructure planning" Introduction to the environment factors and goods: geological ressources, species and biotopes, ecosystem functioning, Air quality, hydro systems, impact of land use systems (especially agriculture and urbanisation, ecological landscape design.

B: Seminar "Environmental impact assessment" In the seminar students have the task to prepare a presentation and a paper about:

- Structuring and evaluation of environmental impacts of strategies and projects
- Legislative aspects
- Modelling and evaluation methods
- Tools for impact modelling
- Case study examples

Alternatively the students work on case study exercises covering strategic regional and urban planning as well as road, housing, industrial, water, sports, tourism and other infrastructure projects

14. Literatur: Information will be provided during the lectures Additional material can be downloaded from ILIAS

Modul: 50560 Project Planning and Financing

4. SWS: 4  7. Sprache: Englisch

8. Modulverantwortlicher: Elke Schneider
9. Dozenten: Klaus-Peter Pischke

11. Empfohlene Voraussetzungen:

12. Lernziele: Students know critical phases of a typical project cycle, they know how to plan, appraise, and evaluate infrastructure projects from the economic and financial point of view, they know different measures to calculate the return of a project in order to evaluate its worth, they know pros and cons of different ways to finance and operate infrastructure projects, solving problems based on real world case studies enhances their ability to evaluate projects themselves or to assess project proposals (e.g. feasibility studies) prepared by consultants.

13. Inhalt:

A: Project Planning and Appraisal (SS)
- Comprehensive introduction into planning and appraisal of infrastructure projects
- Subject description
- the project cycle: major aspects of the different phases
- project planning
- LogFrame analysis as a project planning tool
- project appraisal (financial and economic analysis)
- evaluation of project alternatives
- case studies

B: Project Financing, Implementation and Advanced Issues of Economic Analysis (WS)
- Comprehensive introduction into financing, implementation, monitoring and ex-post evaluation of infrastructure projects
- selected issues of advanced economic analysis of projects
- Subject Description:
  - external and internal sources of financing
  - private sector participation for project financing and operation (BOT models)
  - selected issues in project implementation (implementation consultant, terms of reference, bidding procedures, contract of goods and services) project supervision, monitoring and ex-post evaluation
  - advanced issues of economic analysis of projects including case studies

6. Turnus: Sommersemester

4. SWS: 4
7. Sprache: Englisch

8. Modulverantwortlicher: Dr.-Ing. Richard Junesch

9. Dozenten: Marion Aschmann
Richard Junesch

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: Basic notions of infrastructure planning

12. Lernziele: The students understand techniques for dealing with complex decision situations and gain insights in the decision-analysis process for both public and private decision-making with all related steps. Social aspects that may influence planning process or outcome will also be discussed. The students are acquainted with fundamental notions of demography as far as urban and regional planning is concerned. The students are able to apply basic methods of demographic analysis and forecasting.

13. Inhalt: The module consists of two courses: The lecture "Decision Analysis" will cover the following subjects:
• Elements of Decision Problems
• Structuring Decisions
• Generating Objectives and Hierarchies
• Generating Alternatives
• Decision Making with Multiple Objectives
• Risk and Uncertainty in Decision Situations
• Collective Decision Making
• Application to Infrastructure Planning

The course Demographic Analysis and Forecasting will provide an overview of the most frequently appearing issues of demographic analysis and forecasting. It will consist of three main parts:
Fundamental notions of (applied) demography and some of the methodical/conceptual problems linked with these notions. Selected fundamental approaches to analysing and forecasting natural growth (or decline) of population, will be presented and discussed critically. Examples of such analyses and forecasts will be calculated. Migration, as the most critical and most important aspect of population development under regional aspects, will constitute the main topic of the third part. Basic methods of analysing and forecasting migration will be presented and discussed with regard to their application on concrete cases.

8. Modulverantwortlicher: Anne Weiss
9. Dozenten: Dr.-Ing. Martin Schletterer, Dr.-Ing. Matthias Schneider

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen:

12. Lernziele: Students will know how river ecosystems are functioning. Understanding natural processes is the basis for the assessment of changes in riverine ecosystems and for the development of mitigation measures. They get the basic knowledge about macrozoobenthos and fish fauna, with a focus on the species used in the CASiMiR model. Students will also get familiar with legislation on European level (WFD) and its national implementation.

They can analyse ecological impacts of hydropower driven changes in river systems. They know about the approaches to link requirements of water organisms with hydraulics. They have the skills to translate sampling data into habitat requirement data needed for habitat simulations. They are able to use modeling tools to quantify modifications in the amount and quality of riverine habitats. They are able to do basic assessments of these modifications.

13. Inhalt:

- **River ecosystems**
  - Introduction to limnology
  - Large Rivers: Volga und Danube
  - Macrozoobenthos: Biology, demands of indicator species
  - Fish: Biology, migration
  - Legislation: European WFD, implementation and targets

- **Hydropower: Environmental Impacts and mitigation**
  - Types of HPPs
  - Ecological flow
  - "Fish ladders"
  - Approaches for the description of habitats
  - Fuzzy-rule based modelling
  - Minimum flow and methods for assessment
  - Attraction flow and hydraulic investigation of migration facilities

- **Ecohydraulic Investigations**
  - Ecohydraulics and environmental hydraulics
- Linkages between structural, hydraulic, and biological parameters
- Hydronumeric modelling in low and average flow situations
- Approaches for the description of habitats
- Fuzzy-rule based modelling
- Minimum flow and methods for assessment
- Attraction flow and hydraulic investigation of migration facilities
- Morphological enhancements and model based assessment

Modul: 58100 Constructed wetlands for wastewater treatment

3. Leistungspunkte: 3 LP 6. Turnus: Unregelmäßig
4. SWS: 2 7. Sprache: Englisch

8. Modulverantwortlicher: Anne Weiß
9. Dozenten: Dr.-Ing. Christos Akratos

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: Chemistry and Biology for Engineers
Sanitary Engineering

12. Lernziele: The goal of this course is to provide advanced knowledge of the processes and concepts of constructed wetlands systems to the students. They will get familiar with the existing scientific, technical, and economic practices of using constructed wetlands for wastewater and sewage sludge treatment. For this reason all late scientific developments concerning municipal industrial and agro-industrial wastewater treatment and sewage sludge treatment will be presented, at the end of the course the students will be able to:

- Understanding constructed wetlands' main mechanisms.
- Perform a rough design of constructed wetlands treating various waste waters and sewage sludge

13. Inhalt: Basic principles of constructed wetlands
- Attached growth treatment systems
- Constructed wetlands (basic principles, types, vegetation, porous media, etc)
- Pollutant removal mechanisms and kinetics (organic matter, nitrogen, phosphorus, heavy metals, suspended solids)
- Sewage sludge treatment (de-watering mechanisms, mineralisation processes)

Design of constructed wetlands
- Constructed wetlands' design models (hydrodynamic and pollutant removal models)
- Determination of required constructed wetland area
- Sewage sludge treatment (sludge loading rates, duration of loading and resting periods)

Case studies
- Municipal wastewater treatment
- Agro-industrial wastewater treatment

Sewage sludge treatment

Kadlec, R.H., Wallace, S. Treatment wetlands, send ed. CRC Press

Modul: 68060 Advanced Methods in Biofilm Research

2. Modulkürzel: 021410206
5. Moduldaauer: Einsemestrig

3. Leistungspunkte: 6 LP
6. Turnus: Sommersemester

4. SWS: 4
7. Sprache: Englisch

8. Modulverantwortlicher: Dr. Sabine-Ulrike Gerbersdorf
9. Dozenten: Sabine-Ulrike Gerbersdorf, Kaan Koca

10. Zuordnung zum Curriculum in diesem Studiengang:

11. Empfohlene Voraussetzungen: • Basic experience in laboratory work as well as basic knowledge in ecology, microbiology, chemistry and physics
   • Basic knowledge in microscopy would be desirable

12. Lernziele:
   • The students acquire fundamental knowledge of biofilms (composition, main species, requirements, occurrence, functionality and ecosystem services)
   • The students deepen their ability to work analytical in the laboratory on the micro- and macroscale
   • The students broaden their portfolio of applied methods ranging from autoclaving to photometry
   • The students apply microbiological techniques in freshwater ecology
   • The students learn about the most common biological and chemical parameters concerning biofilm research but also beyond
   • The students are familiar with light microscopy and get first hands-on experience with electron microscopy
   • The students know techniques to determine biofilm topography
   • He/she can measure biofilm adhesion with electromagnets
   • The students get familiar with measurements and data evaluation concerning hydrodynamics and bed roughness

13. Inhalt:
   • Growth of a monocultural biofilm (bacterial origin) (cultures, nutrient broth, autoclaving)
   • Growth of a natural highly diverse biofilm (preparing substrates, circulating freshwater from river in mini-flumes)
   • Monitoring of biomass/cell numbers and growth (bacteria: Ultrasound, Staining, Flow Cytometry, Microalgae: Chlorophyll a Extraction, Photometer)
   • Extracellular polymeric substancen (EPS) : Extraction, Determination of sugar - and protein content in the matrix
   • Microscopy: Light-Microscopy to determine the most prominent species as well as address biofilm topography. Electron-Microscope to visualize various biofilm structures
   • Structure from Motion: Visualisation of three dimensional biofilm structures
   • Functionality of biofilm: Biostabilisation of sediments, measurements of the biofilm adhesion via MagPI (Magnetic Particle Induction)
   • Excursion to collect and observe biofilms in their natural habitat
   • Flow velocity, turbulence and bed roughness – characterisation of hydrodynamic features
More milestone publications (e.g. Reviews) will be recommended |

Modul: 75550 Data, Statistics and Optimization

2. Modulkürzel: 021440002
3. Leistungspunkte: 6 LP
4. SWS: -
5. Modulduauer: Einsemestrig
6. Turnus: Wintersemester
7. Sprache: Englisch
8. Modulverantwortlicher: Univ.-Prof. Dr.-Ing. Wolfgang Nowak
9. Dozenten: Prof. Dr.-Ing. Wolfgang Nowak
Dr. Anneli Guthke
10. Zuordnung zum Curriculum in diesem Studiengang:
11. Empfohlene Voraussetzungen:
12. Lernziele:
   Teil „Data and Statistics“:
   Teil „Optimierung“:
13. Inhalt:
   Teil „Data and Statistics“:
   • Preprocessing, Visualisierung und Analyse von Daten
   • Uni- und bivariate deskriptive Statistik
   • Lineare Regression
   • Grundlagen der Wahrscheinlichkeitsrechnung
   • Ausgewählte Verteilungen
   • Zufallsimulation
   Teil „Optimization“:
   • Definition und Klassifizierung von Optimierungsproblemen
   • No-Free-Lunch Theorem
   • Einführung von Optimierungsalgorithmen mit Anwendungsbeispielen
   o Simplex
   o Steepest Descent, Newton, Levenberg-Marquardt
   o Heuristiken: Evolutionäre Algorithmen, Simulated Annealing
   o Modellkalibrierung als Optimierungsproblem und als bedingte Zufallsimulation
14. Literatur: slides, script

**Modul: 75720 Computational Methods in Environmental Modelling**

4. SWS: -  7. Sprache: Englisch
8. Modulverantwortlicher: Dr. Sergey Oladyshkin
12. Lernziele:
13. Inhalt: Das Modul bietet eine Einführung in die Berechnungsmethoden, die häufig in der Umweltmodellierung verwendet werden. Es werden nützliche Funktionen der MATLAB-Software als eine der produktivsten Software-Umgebungen für Ingenieure vorgestellt, außerdem werden numerische Algorithmen ausführlich diskutiert.
   • Einführung in die MATLAB-Programmierung
   • Lineare Gleichungen
   • Nichtlineare Gleichungen
   • Approximation
   • Integration
   • Gewöhnliche Differentialgleichungen
   • Unsicherheits-Quantifizierung und stochastische Modellierung
14. Literatur: Vortragsfolien, Vorlesungsskript
